Key features AutoCAD 2020: Dynamic Linking AutoCAD supports file types that contain text, such as AI (AutoCAD Illustrator), XM (XML Mindscape), DXF (AutoCAD Drawing Exchange Format) and DWG (AutoCAD Drawing). To open a file type that contains text in another application, such as a text editor, the first step is to convert the text to character code in the file type so that it can be read by the other application. The text file is transformed using a process called dynamic linking. Dynamic linking allows AutoCAD to dynamically link to other applications. How dynamic linking works The Data Link Manager (DLM) program is used to convert data to a different file type. This may be for temporary use or to create an archived file, such as a backup file. The Data Link Manager is used to convert a data file to a drawing file. As the file is being converted, text is checked against a set of common text characters to make sure that it is in fact text before the conversion process continues. If there are no match, the Data Link Manager asks the user whether the file should be converted into a drawing file. The user can choose not to convert the file, in which case the file is converted into a text file with the proper file extension. Working with Text Files If the file has been converted to text, then the user may copy the file to the clipboard or open it for editing. In the case of the copy, the file is copied from the location that it was previously converted to a text file. To work with a converted text file, it can be opened in any text editor. If the text file has a proper file extension, the user can edit the text file as with any other text file. If the text file has an extension that does not match the appropriate file extension, then the file is opened by the Data Link Manager. The file is then converted to the appropriate file type and saved. Autodesk has worked with industry leaders to develop the Dynamic Linking feature, which enables AutoCAD to send text files to other applications. AutoCAD can send text files with the following file extensions: Ai (AutoCAD Illustrator) XM (XML Mindscape) DXF (AutoCAD Drawing Exchange Format) DWG (AutoCAD Drawing) MLL

A user must hold the option key to use automatic alignment. Reverse-slope: can be done with reverse-slope tool in 2D or 3D Skew: used to make a line horizontally or vertically aligned with another line. The skew tool can be found in the edit menu. Mirror: used to flip the view of a line 3D features User-defined workplane: enables the user to define and easily share a workplane for further planning and analysis. The workplane is a defined plane where the 3D objects of the drawing are rendered as 2D. An example is a desk where it is necessary to take into account the thickness of the objects that are being used. Snap: when working with the vertices of a line, the user can specify where the line's vertices are to be snapped to each other. These snapping points can a1d647c40b
