The C-strain marmoset model was developed in New World primates, which were naturally infected with EBOV. This model is highly effective in blocking EBOV infection, as has been shown in multiple independent experiments. Its robustness is further highlighted by its suitability for the development of vaccines and therapeutics. However, when challenged with the EBOV, the C-strain marmosets succumb to the infection, despite the robustness of the model. We report here that the C-strain marmoset model is highly susceptible to infection with EBOV, as compared to the S-strain, M-strain, and B-strain marmosets. A viral challenge of 8.8×10(3) pfu of EBOV led to only 1 of the 5 C-strain marmosets surviving, while all the marmosets of other strains died in 21 d. The robustness of the C-strain marmoset model can be explained by its susceptibility to primary EBOV infection. In a first round of infection, the C-strain marmosets succumb to the infection, which leads to massive viremia. The viremia hampers a second round of infection and leads to fast death in the C-strain marmosets.[Informed consent: Italian practice]. An increasing number a1d647c40b

"You're playing for next day. That's how we've approached it, and that's how we need to approach it." The manager made his pitch after the game.
