Bone strength is the ultimate limit for the survivability of long bones. The importance of cancellous bone tissue to bone strength makes fracture of cancellous bone the most common failure in long bones. The principal failure is the fracture of the trabeculae. The primary objective of this study was to develop a three-dimensional finite element model of the proximal tibia for the prediction of the fatigue life of the cancellous bone of this bone. The secondary objective was to compare the results of a model with fatigue life data obtained from porcine proximal tibias with that of a model without fatigue life data. The model was constructed from data of cancellous bone of proximal tibias of New Zealand white rabbits. The fatigue life of the cancellous bone was predicted from the stress distribution in the model. The predicted fatigue life of the cancellous bone of the proximal tibia was compared to the fatigue life data of porcine proximal tibias reported in the literature. The model was calibrated to match the experimental stress distribution and fatigue life data. The predicted fatigue life of the cancellous bone of the proximal tibia was in close agreement with the experimental fatigue life data. The predicted fatigue life was also similar to that of porcine proximal tibias. There was a strong statistical association between the predicted fatigue life and the experimentally obtained fatigue life. The model can be used to evaluate fatigue life of the cancellous bone of any long bone.Efficacy of rifampicin in the treatment of pulmonary tuberculosis. A randomized, double-blind, placebo-controlled study was conducted to assess the efficacy of rifampicin (RFP) in the treatment of pulmonary tuberculosis. A total of 130 smear-positive adults with pulmonary tuberculosis were randomly assigned to RFP (600 mg of RFP administered daily for two months) and placebo (PL) groups (65 patients in each group). An additional 120 patients were followed as treatment failures and evaluated for disease and treatment outcome. In the intention-to-treat analysis, the cure rates at the end of 2 months were 86.4% (21/24) in the RFP group and 38.5% (12
