What is actually the command debugall in JavaScript? I have done some debugging with Node.js and find that when I run the command node debugger I am able to understand which line of code is causing the problem, and hence it makes debugging a lot easier. But can somebody explain to me how exactly does the debugall work? A: These lines are added to the script that is being debugged. It will appear as if you are using a debugger. The debugger (in this case the debugall) will tell you the type of the expression on the left side of the assignment. VisualDependencies is a tool that helps you to visualize the dependencies of your databases. Most of the time the dependencies of your databases can be defined by using different SQL Server table/views (and their foreign keys). You can also use another tool such as SQL Server Management Studio to create database diagrams. VisualDependencies is specially designed to be user friendly. No knowledge about databases is required. You can use VisualDependencies as it is or you can use it to extract information from your database. You don't need to be connected with the database to use VisualDependencies. VisualDependencies is a very small program. It has only 68KB of filesize. This makes it a perfect tool for quick reference. Because VisualDependencies is so small, it is easy to integrate it in your database. Installation Note : I have been using VisualDependencies for more than a year now. I have used VisualDependencies on my personal computer for a long time. My server is based on windows server. I have used VisualDependencies on multiple servers. VisualDependencies aims to visualize the graphical dependency structure of your databases. You can use it to identify dependencies between databases, see what databases are associated with each other, and run queries on either of the databases to retrieve information. Open VisualDependencies and the following window will open: This is the visualization of the dependencies of your database: If you click on one of the database in the graph, the viewer will highlight the following information: Database name Database file location Number of databases Number of related databases Nodes which has no relation to other nodes Once you have the information that you require, you can export the information to CSV or to Excel for further analysis. VisualDependencies Supported Data: The supported data types are: Database name Database file location Related database name Related database file location Node value (which isn't a database name, but rather a relation between a database name and a database file location) You can either navigate through the data by using the "Previous" and "Next" buttons or you can click the gray "cell" buttons on the edge of the graph to move the cursor to a specific cell. Once the cell is highlighted, you can either delete the cell or change the value of the cell. When you select a database name, you can also highlight the database file location with the "Open" button. You can also double click on a file location to open the file. I suggest that you check out the ReadMe.txt file which gives more details about this application.
