AutoCAD has become increasingly popular since the early 1980s, thanks to its large and active user community and the fact that it has been easily available to use for free since it was first released. What is Autodesk AutoCAD? AutoCAD is a 3D drawing software application used for 2D and 3D drafting, design, visualisation, and data management. It is designed to work with the 2D Drafting, Engineering, and Technical (D&T) file format. It supports a wide variety of 2D features, including: 2D and 3D drawing (including using the same symbols and tools) paper space with unlimited dimensions, grids, and scales snap to dimensions, guides, and other 2D objects support for many different predefined and user-drawn styles of 2D symbols, hatch patterns, linetypes, and fills support for advanced 2D vector symbols support for many different predefined and user-drawn styles of 2D fills and gradients support for many different predefined and user-drawn styles of

Interfaces Visual LISP, the original implementation of the ADL is an extremely powerful scripting language with native support for objects, functions, arrays, strings, classes and all standard programming language features. Visual LISP scripting language is multi-threaded. Visual LISP also supports a number of application programming interfaces (APIs) for automation and customization, including: Direct access to drawing commands Callable objects in the drawing (e.g., paths, groups, Xrefs) User preferences and settings Model data (including floating-point number values) User interface (UI) elements (e.g., windows, menus, dialog boxes) Drawing commands An important aspect of Visual LISP is that it can be used on top of a variety of programming languages (e.g., C++, JCL,

ObjectARX,.NET, MQL, C#, JavaScript, VBScript, VB, VB.NET, PL/SQL, Delphi, Visual Basic.NET, etc.) and is non-dependent on the original programming language. The minimum Visual LISP program looks like this: The variable `s:circleRectangles` is the name of the variable that stores the object names that define the set of path objects that is to be added to the selection set, and can also be used to iterate through the path objects. For each object, `s:circleRectangles` is evaluated by calling the `PathAdd` object (see below). `PathAdd` takes a list of arguments, the last of which is an `Xref` object. Since the `Xref` object is not visible in Visual LISP it is specified as an array of its members. The first argument is a path name. In this example, the path name is the name of the path object `circleRectangles`. The second argument is a (x, y, w, h) rectangle object defining a shape within the path object. The third argument is the name of the rectangle to which the path is to be added. In this example, the rectangle name is named `ABCDEFGHIJ`. `PathAdd` is not the only way to add a path. The

PathAdd function does not add the path as a linear object to the drawing. It will add the path as a closed path if you use the PathAdd function with the parameter true. In this example, the PathAdd function adds the path to the drawing as a
