Immunostaining of meningiomas with anti-EGFR antibody identifies patients responding to gefitinib and erlotinib. Although the expression of epidermal growth factor receptor (EGFR) is associated with malignant behaviour in meningioma, the response of this tumour to EGFR-targeted therapies is unknown. We investigated the expression of EGFR and its downstream target c-RAF and their prognostic significance in meningiomas. We also investigated the response of meningioma cells in vitro to gefitinib (gef) and erlotinib (erlo), using cell proliferation and flow cytometric analyses of apoptosis. Tumour specimens from 50 patients with meningioma were

---

analysed by immunohistochemical staining with antibodies to EGFR, c-RAF, Ki-67, P53 and MIB1. Epidermal growth factor receptor (EGFR) expression was observed in 75% of meningiomas and its expression was associated with an aggressive tumour phenotype. The Ki-67 proliferation index was significantly higher in EGFR-positive meningiomas than in EGFR-negative meningiomas (P<0.05). The offseason has provided many stunning surprises, but none of them were more surprising than the unsurprising signings of Chivas USA.
