Rapid preparation of S-glutathiolated protein cysteines in situ without interference from S-nitrosoglutathione. We have described a method of preparing proteins containing S-glutathiolated cysteine residues in situ in two-dimensional electrophoresis without causing S-nitrosoglutathione to be added to the sample. Modified proteins can be quantified with the aid of the reduced protein spot intensity of the unmodified protein, which is lowered by 2-4 times after S-glutathiolation. To verify this method, peptides of human serum albumin were incubated with glutathione or L-cysteine in varying molar ratios, and were then analyzed. 2-D separation of the cysteine-containing tryptic peptides is easily done by mixing S-glutathiolated and non-glutathiolated samples in equal ratios and applying 2-D separation on a 15% polyacrylamide gel. S-Glutathiolation was determined by Western blot analysis using anti-S-nitrosoglutathione antibody. The presence of S-glutathiolation in the protein sample was also confirmed by a diagnostic staining procedure using mercury-mercuribenzoate. Rooting out such list has begun within the team and people have started sending replies to other teams asking whether they want to follow up. "Such list is very long. It's not final. You'll get to see if anybody wants to follow up. Let's see if we can complete it by the end of this month," he said. People working on the project include MS Dhoni's personal assistant R V Sathyanarayanan, S R Naushad (third umpire) and his son M A Naushad (head groundsman). Also, R V Sathyanarayanan's wife and sons work in the team. "We try our best for our players. Most decisions are taken by Dhoni, when it comes to grass, we have no say," he said. The major players in the Indian cricket - the captain and wicketkeeper Rohit Sharma, pace bowlers Jasprit Bumrah, Bhuvneshwar Kumar, Mohammed Shami and Ishant Sharma and all-rounder Hardik Pandya - reportedly wish to include the batting green. "We are on the same page with the players.

The invention relates to a fuel injection device. It relates more particularly to a fuel injection device for use in internal combustion engines comprising a piston, and a piston rod, and pressure chambers provided in a cylinder head. In a known fuel injection device such as that described in French patent application 2,326,428 the pressure chambers comprise a first chamber, and a second chamber to each of which a nozzle is attached. The first chamber is intended for supplying fuel to the first nozzle, and the second chamber is intended for supplying fuel to the second nozzle. These two nozzles are closed by valves respectively opening out into the first chamber and into the second chamber. This known fuel injection device is very difficult to make because the size of the pressure chambers has to be selected with great caution. In particular, the distance between the two valves is critical. Accordingly, an object of the present invention is to improve the function of a fuel injection device and in particular the function of the valves. To this end the fuel injection device in accordance with the invention is such that it comprises a common cylinder head, a piston arranged in the cylinder, and a piston rod for actuating the piston. Two pressure chambers are provided, one chamber being located at the end of the piston rod and the other chamber being located at the end of the cylinder. The two pressure chambers are in communication via a single central passage formed in the piston rod. Furthermore, the pressure chambers are defined by a wall which extends axially between a first part located towards the piston rod and a second part located towards the cylinder. The end of the piston rod towards the piston is provided with two adjacent nozzles. Two valves are provided one for each of the nozzles in the first part of the wall. The arrangement is such that the two valves of one nozzle are open towards the other nozzle. Moreover, the valves are identical, and the first part of the wall has a circumferential groove intended to receive one of the valves. Each valve comprises a base or the like and a rod which slides in the groove. The rod is provided with a part intended to come into contact with an end face of the groove. The base is held in a fastening member provided in the cylinder head. A valve of this

kind is relatively simple and cheap to make. Moreover, the nozzles and valves are independent of one another. The valve can be made out of any material, such as synthetic material, and can have any shape. According to a particularly advantageous
