At the present time the cost of materials for making such waveguides is quite high. For example, optical waveguides which are intended for use as optical fibers must have a refractive index of approximately 1.5. As discussed below, optical waveguides which are to be used as optical interconnects (i.e., optical bus transmission lines) can have a refractive index of only about 1.5. Optical waveguides which are intended to be used as planar waveguides, although typically they will have a higher refractive index, will typically have a lower cost than optical waveguides intended for use as optical fibers. For example, molded refractive index (i.e., refractive index of a polymer) or encapsulated waveguides fabricated from polymeric materials are commercially available at low cost. However, such waveguides generally have a relatively high refractive index and therefore cannot be used as optical fibers. Although molded or encapsulated waveguides fabricated from glass or ceramic materials are now commercially available, such material costs are still relatively high.Tilden Sands The Tilden Sands () are a sand sea or inland saltmarsh and tidal wetland in the southeast of Suffolk, England. The area is a sparsely populated part of the coast, mainly used for the grazing of livestock. The Tilden Sands lie on the south coast of the Domesday Elmham Limestone which is formed from the Triassic Bullhams Limestone. The approximate area covered is 70 hectares on
