The crude polysaccharide fraction of the edible moss Polytrichum commune (Polytrichaceae), rich in polysaccharides and coumarins, has shown anti-inflammatory activities. We purified it by three chromatographic steps that gave one major active compound: a neutral oligosaccharide with a molecular mass of 1 kDa. Its structure, obtained by NMR, MS, and fragmentation data, is the esculin. The kappa/iota ratio of this esculin was determined by MS/MS. The compounds, e.g., chalcones, contained two to four methylthio groups in their structure. The effect of some coumarins and of esculin on the catalytic activity of human neutrophil and monocyte-derived myeloperoxidase (MPO) was evaluated. The esculin showed an inhibition of the enzymatic activity of MPO, with 50% inhibitory concentration of 3.6 microg/mL. The following coumarins were also active: 13-O-benzoylscoumarin,

2,3-dihydro-13-hydroxy-3-methyl-2-oxo-2H-1-benzopyran-5-one, 2,3-dihydro-13-hydroxy-3-methyl-2-oxo-2H-1-benzopyran-5-thione, and 2,3-dihydro-13-hydroxy-3-methyl-2-oxo-2H-1-benzop
