Obd Facile Keygen.Digital metrology Digital metrology (or digital metrology) is metrology carried out using digital means. In the common conception, digital metrology is meant to cover the metrology performed with or using digital measuring instruments. In reality, there are different kinds of digital metrology. Non-contact metrology In non-contact metrology, such as for example in electronic projection measurements, the object surface is imaged onto the sensor, e.g. an active or a passive electronic detector. Contact metrology In contact metrology, such as for example in measuring machine tools, the sensor is in contact with the object surface, e.g. by touching it. Digital surface measuring Digital surface metrology describes metrology for measuring the surface of a solid body. Digital surface metrology is based on the use of a measuring head, which can be moved over the surface of the object to be measured, to measure the surface and/or profile of the object, e.g. a rail. Different methods for digital surface metrology are based on confocal or projection methods, phase shifting methods, triangulation methods and confocal interferometry. Non-contact surface measuring In non-contact surface measuring, such as for example in surface coating and surface analysis, the object surface to be measured is illuminated and the (part) of the incident light that is scattered by the surface to be measured is measured with a sensor, e.g. a camera. Contact surface measuring In contact surface measuring, such as for example in surface coating and surface analysis, the sensor is in contact with the surface to be measured, e.g. by touching it. 3D surface metrology 3D surface metrology is based on the metrology of 3D objects by means of a scanning mechanism, a measuring head and an appropriately designed metrology software.
