Some information is also presented on how AutoCAD deals with various types of files. The user interface (UI) refers to the Graphical User Interface, or the interface that humans can see. A'schema' is a set of rules used by the software to identify and interpret the various objects in a drawing, including lines, polylines, curves, dimensions, text, symbols, etc. An 'add-on' refers to a set of software components or resources that are not part of AutoCAD. The term is used in the same way that users would describe a set of tools that can be accessed from the user interface menu, such as 'geometric dimensions'. A'software add-on' is a set of software components that are provided by Autodesk that can be used to enhance the functionality of AutoCAD. A 'graphical user interface (GUI) add-on' is an Autodesk-developed program that is delivered to users as a separate application and is executed in the same manner as other AutoCAD add-ons. A 'command-line interface (CLI) add-on' is an add-on that is installed in the AutoCAD registry and requires its own installation program. X-refs are cross-references that help to bring into view additional information about the elements of a drawing. X-refs are used to view the plans, elevations, section views and other drawings that are located within the 3D-view. X-refs are also used to access the information on other drawings. The ability to create X-refs is called X-ref management. X-refs are marked with a (View link) icon and are usually located at the top right of the 3D view. X-ref management consists of three components: Creation, Maintenance, and Update. Creation requires a drawing or object to be the source, the target and the reference. Maintenance is the X-ref selection process. Updates may occur when the target is changed. Reference points are points or polygons that are placed in the drawing to provide a temporary point of reference for the user. Reference points are very useful for aiding in the drawing of non-

measurable objects such as electrical circuit layouts. Reference points can be used to mark areas and points that should be analyzed further or in the drawing. Reference points are typically placed on a separate layer to the rest of the drawing. References External links AutoCAD Tips & Tricks – a monthly article series from Autodesk. A Study on Semen Quality of Sheep Breeders in Nigeria. The occurrence of abnormal semen in the breeding of rams in Nigeria was investigated. A total of 154 breeding rams belonging to 47 sheep farmers were evaluated. Semen quality was assessed using the methods of the World Organisation for Animal Health. Semen was obtained from the rams using the artificial vagina, colour coded and smeared on glass slides to determine the sperm morphology. Concentration was calculated and expressed as sperm concentration (million/ml), % of morphologically normal sperms and % of sperm with abnormal head. The level of testosterone and follicle stimulating hormone in blood was measured. The results of this study showed that 66.1% of the breeding rams showed low sperm concentration (less than 20 million/ml). The morphologically normal sperms constituted 19.9% and abnormal sperm head constituted 13.4% of the sperms. The blood testosterone concentration of the breeders ranged from 0.4 to 3.9ng/ml (median = 1.8ng/ml) and that of the follicle stimulating hormone concentration ranged from 0.3 to 12.0µg/l (median = 5.1µg/l). A statistically significant association was found between the abnormal sperm head and the follicle stimulating hormone concentrations (P = 0.0286). The results of this study suggest that there is a significant relationship between the follicle stimulating hormone concentration and the occurrence of abnormal sperm head in the breeding r
