A common problem in computerized radiotherapy is the need for patient immobilization. For example, in portal-image-guided radiation therapy ("PIG-RT"), patient alignment for portal acquisition is achieved by immobilizing the patient during treatment. In PIG-RT, an x-ray imaging device is mounted on a medical gantry. The gantry rotates the x-ray imaging device about the patient. The x-ray imaging device detects at least one x-ray source image of radiation generated by the x-ray imaging device and emitted by the x-ray imaging device in at least one direction toward the patient. The detected x-ray source image is used to determine the position of the x-ray imaging device. In PIG-RT, the patient is automatically immobilized by the use of immobilization devices, such as, for example, vacuum beds, to maintain the position of the patient's body during the PIG-RT session. The x-ray imaging device acquires multiple images of the patient, such as, for example, projection images in at least two planes, simultaneously or in alternation, to provide positional information of the detected x-ray source image with respect to a predetermined reference point, which provides positional information of the patient's body. The patient's current position is determined by comparison of the acquired images to a reference image, using a positioning device to align the reference image to a reference mark, by moving a reference point on the imaging device to a reference point on the patient's body. Based on the determined patient position and the predetermined reference point, the patient position can be adjusted by moving the patient's body in the direction of the reference point. Alternatively, the patient's body is moved on a treatment couch in the direction of the reference point. The process of acquiring images of the patient, and then aligning the reference image to the reference mark, using the positioning device, and repeating the positioning process is typically time consuming. Additionally, the process requires the patient to maintain an approximately stationary position throughout the PIG-RT session. This repeated patient immobilization makes PIG-RT less useful for patients who have difficulty

No matter how many services you have, how busy you are, how many clients you have and how many hours you spend on the road, you should always take some time to ensure that your Internet connection is working perfectly. In most cases, problems with this kind of connection can be easily resolved by disconnecting and reconnecting the cable at the router. But what if there was a simple and efficient way of troubleshooting the connection from anywhere in the world? There is. Having worked with over 50 clients, we have seen it all and yet the things we are

about to reveal will be so simple, you'll be convinced you've known them all along. Now we're going to tell you how to use the network diagnostic programs and utilities provided by your Internet Service Provider (ISP), if they are available. In this tutorial, you'll find out all there is to know about the various programs and utilities, how they can be used and how to make the best use of them. To begin, you should know that not all ISP's have these tools. We'll explain in a second how you can find out if you have them or not. If you don't want to, or can't use them, don't worry. You can still troubleshoot your connection without those tools and that is what this tutorial is all about. Now how can you use these tools? Simply hook your modem/router up to your computer and go to the programs folders.

10 Disney Animated Movies That Have Lost Their Touch

For the longest time, Walt Disney was the undisputed king of animated films. From its first opening day in 1950 with Pinocchio, his films quickly evolved into three dimensions, featuring cameos from their live action counterparts, immersive sound and witty jokes, all wrapped in beautiful visuals, and it didn't stop until the nineties with the likes of Aladdin and The Lion King. It was a golden era. But then came Cars 2, a misfire from start to finish, which ironically, replaced Cars with a new, underwhelming movie, replacing that time-honored name with Cars 3. Other lesser known animation giants like Dreamworks weren't so lucky either, as their animated films, such as Robot Chicken, ended in disgrace. Nowadays Disney's animation department seems to have lost its touch entirely. From spinning b7e8fdf5c8

Background ===== The present study aims to evaluate the impact of surgical treatment on the long-term outcome of patients with severe post-infarction left ventricular (LV) dysfunction and on the LV pump function. Methods ===== In 80 patients with post-infarction LV dysfunction and severe depression of LV function, which required mechanical circulatory support (MCS) for more than 7 days, the long-term effects of treatment were evaluated. All patients were categorized into two groups: with treatment (n=44) and without treatment (n=36). A control group (n=10) consisted of survivors of acute myocardial infarction with no hemodynamic support. The follow-up period was 12 ± 7.2 months. A total of 36 patients (45%) required MCS therapy for 4-21 days (median 9). Left ventricular ejection fraction (LVEF) was $29 \pm 6\%$ preoperatively and $15 \pm 4\%$ before discharge (p\

What's New In?

Bloggers Vol 4 is a small icon collection that was designed in order to provide you with a nice means of giving a new look to all your files and folders. Included in the Bloggers Vol 4 package you will find ICO format files representing post-it, tag and backwards actions as well as a couple more icons. Bloggers Vol 4 consists of 18 PNG, ICO and PSD files.

How to Make a Brown Paper Bag If you've made a ton of brown paper bag crafts in the past, you've probably found yourself wondering just how you'll turn them into bags the next time around. The answer is simple - just make an origami tutorial! When the bag is almost done, go ahead and glue down the seam and reinforce the side that will hang. This project is certainly one of the simplest you'll ever make. You'll Need: One brown paper bag Cutting tools Glue Directions: To fold a paper bag, start by folding in half. Then fold in half again, crease down the middle. Fold it diagonally to make a triangle and unfold it. Crease the side you want on the bottom. Cut the sides off, one in each corner, diagonally with the fold from the bottom. Once you have four triangles, slide them over a length of string tied together in a knot. Make a few more adjustments as needed to secure the bottom of the bag. Since you'll be gluing the paper, take extra time to pick the right glue for the job. Make sure it dries clear.

[Comparison of two methods for detecting genomic aberrations: fluorescence in situ hybridization and reverse chromosome painting]. To compare two methods for detecting genomic aberrations: fluorescence in situ hybridization (FISH) and reverse chromosome painting (RCP). Both methods were used for chromosome preparations of the 5 lymphocyte cultures of a normal male. FISH detected 14 aberrations, among which 7 were reported before in the literature. RCP detected 8 aberrations. These aberrations included 5 of the previously reported

aberrations, and 3 novel aberrations. FISH and RCP are complementary methods in the study of genomic aberrations. FISH is sensitive but labor-intensive, whereas RCP is efficient but only semi-quantitative. Combining these methods can provide information of genomic aberrations and of inter-chromosomal
