5. **Add a layer on top of all layers with a layer mask.** Turn on the layer visibility so that it is visible. With the Brush tool active, choose an appropriate brush shape. Click and hold the mouse in the center of the brush to adjust the size. Click and drag or with the mouse wheel to make adjustments, as shown in Figure 7-18. **Figure 7-18:** A brush is a useful tool for creating intricate designs or for painting on an image. Photoshop has many brush options including the following: * The Pencil tool can be used as a brush for strokes or to create a hard-edged outline, as shown in Figure 7-19. A soft brush is useful for spot color, and a round or elliptical brush is great for creating a circular or elliptical shape. * The Brush tool comes in many shapes, including brushes designed for specific purposes such as painting, drawing, or painting. Experiment with the tool to see what shape works best for your needs. * The Airbrush is a great tool for spot color. It features an airbrush tip that provides a fine line and is ideal for adding details to an image. * The Gaussian Blur Filter lets you create a soft, blurry look. * Spot Healing Brush, an enhancement tool that reads images, helps to remove unwanted objects or errors from an image. * Adjustment layers, a type of layer that can contain adjustments such as exposure, brightness/contrast, or hue, are discussed in the later section, "Creating Adjustment Layers." **Figure 7-19:** The pencil tool has a range of brush shapes, from thin to thick and pencil to oil pastel. Photoshop has extensive tutorials for using brushes and other tools. Most, however, are not online, and many photogs are frustrated that they cannot find them. You may also find Photoshop tutorials in downloadable forms. One sure fire source is YouTube. Here you will find many videos including online tutorials. In addition, printable forms of Photoshop tutorials are available, with entire books that contain tons of helpful tools. Visit www.photoshoptutorials.com and www.tutorialspoint.com for more help.

If you're looking to open and edit images in the Mac OS X Finder and on your Mac, this is a small selection of the applications that come bundled with the OS X operating system. All these applications are free for personal use, but some of them require paid membership to use additional features such as a commercial license. Many of these applications support saving files in macOS open standard Portable Network Graphics (PNG), Apple's new graphics format designed to scale well. Each image saved in PNG format is about 40-50% smaller than the same image in the previous format, JPEG, and supports transparency. Apple created PNG to meet the needs of digital camera users and others who have high-resolution images that need to be emailed, posted to websites, shared on social media or uploaded to the cloud. The Contacts in macOS open standard Portable Network Graphics (PNG) The Contacts in macOS open standard Portable Network Graphics (PNG) is a free and open source application that shows contacts in a PNG format by allowing you to search, sort, edit, view, copy and print contacts. The Contacts in macOS open standard Portable Network Graphics (PNG) supports all of the most popular smartphone and computer platforms, including Windows, Mac, iOS, Android, Linux, iOS, and macOS. You can access the Contacts application in macOS open standard Portable Network Graphics (PNG) using the Contacts folder in the /Users/Shared/Contacts folder. The Contacts in macOS open standard Portable Network Graphics (PNG) offers some extra features that set it apart from other contacts applications, including: Add and edit contact photos Edit/delete/rename email addresses Add a photo of your business card Add and modify non-US phone numbers Add and modify US phone numbers Auto-format Automatically sort by contact name Create shared groups of contacts Copy and paste contacts Save contacts to a file Search contacts To add a new contact photo, navigate to the /Users/Shared/Contacts folder. High grade bladder cancer is relatively radioresistant, and radiotherapy is one of the most common therapies used in the treatment of this disease. The process of DNA damage recognition and repair in the bladder is poorly understood, and thus the molecular basis of the response to ionizing radiation (IR) has not been elucidated. The overall goal of this proposal is to gain knowledge on this process so that treatment of the disease can be improved. The specific aims are to determine: the DNA-damage-responsive transcription factor; the interplay between the transcription factor and other DNA damage response proteins; and the specific target genes of the transcription factor. Two important features of the proposed work are the generation of a double-knockout mouse system that removes the gene encoding the transcription factor and allows analysis of the protein and its interplay with other factors, and the analysis of the response of this system to IR as a model for the response of bladder to radiation. In Aim 1, we will generate a system in which the transcription factor is knocked out, and determine the consequences of this by analysis of the affected cellular responses. To this end, in Aim 2 we will identify novel proteins that interact with the transcription factor using the yeast two-hybrid system and confirm these interactions in mammalian cells. In Aim 3, we will generate a full set of transcription factor knockouts in the mouse, and will determine the phenotype of the knockouts in cells exposed to IR. These phenotypes will be compared with those observed in Aim 1, and the ultimate goal is to pinpoint the primary phenotype of the transcription factor. In Aim 4, we will determine the interaction between the transcription factor and the response of the transcription factor to IR. This is a global aim, as the three other aims focus on determination of the specific target genes of the transcription factor using chromatin immunoprecipitation.

Q: How to prevent UIKit from display on iPhone 6 I'm developing a small app that I'd like to test for iPhone 4, 5, and 6. The problem is that it looks extremely large and pixelated on iPhone 6 compared to the other devices. I've tried subclassing UIViewController, but I can't figure out how to change the main view's size. I'd like it to be as big as the ViewController itself in portrait mode. Is there an easy way to accomplish this? A: I'm afraid you can't do that, per se. If you're using auto layout, the

Q: java.lang.IllegalArgumentException: Cannot create a file when another process has it open in android I have a problem with Java-Fileopen, I do not know why I have an error: java.lang.IllegalArgumentException: Cannot create a file when another process has it open. This is my code: `Bitmap bitmap = BitmapFactory.decodeFile(file.getAbsolutePath()); Bitmap bitmap2 = Bitmap.createScaledBitmap(bitmap, 50, 50, true); OutputStream out = new FileOutputStream(file); Utils.saveBitmap(bitmap2, out);` I have read this post: [Android - Cannot create a file when another process has it open](#) The error in method `saveBitmap()` And this post: [Java.lang.IllegalArgumentException: Cannot create a file when another process has it open](#) I do not know what is the problem, I had tried to close the process before fileopen, but the error has not gone away and file is open with the same name. Help please A: I don't know how you are getting the exception, but what you are doing is opening a file in read/write mode. This doesn't allow you to write to a file until the other process has closed the file. You could open the file in read-only mode, which would work (it is tricky to code, as you need to open the stream, read it and then close it). Given that this is a bug in Android, the `openFile()` method takes a flags parameter that lets you open the file in read-only mode.
