DANTE.The present invention relates to data storage systems. More particularly, the invention relates to the management of a data storage system. One common technique for managing and transferring data between applications and data storage systems is a tape library. As an example, many computers require backup of their stored data to allow recovery in the event the primary data source becomes damaged or destroyed. Further, the collection of data from many computers often is reduced or divided into smaller collections by a tape library. Using tape libraries for data transfer, however, places a high demand on the physical resources of the tape library. Furthermore, tape libraries are notorious for long wait times. Longer tape library wait times can lead to an increased workload for the tape library system. When the workload of the tape library system is too high, the tape library may not be able to keep up with the demands of the computers that it is servicing. In such cases, the tape library will transfer the data using the least amount of tape to accommodate the demand. This leads to data transfers of insufficient amount of data or at a reduced data transfer rate. Further, because data is transferred to a tape library using a reduced amount of tape, data from computers may be severely delayed. Further
