EXCLUSIVE

while it is important to detect cyber attacks, it is also important to respond quickly and effectively to mitigate damage. having a process in place to respond to an incident is essential in order to ensure that data is secured and the incident is contained. the key to an effective response is to have an incident response team that is trained in the same way as an information security team, to ensure all steps are taken in a timely manner, and to minimise the impact of any downtime on a business. disa instituted an approach for data-intensive, computer-aided information systems in the mid-1980s, and it continues to evolve. according to the defense support center, the national security agency and department of defense have spent more than \$25 billion on information technology since 1999. 54 in 2003, dod began to implement a software process known as the software process improvement and execution (spie) framework. 55 the intent of spie is to improve software development by establishing a formal process to deliver software products on time and within budget. 56 spie is a process for the technical management of all phases of the software development lifecycle, and contains two principal elements: requirements and design. 57 this process was first implemented by the army, followed by the air force, and was subsequently adopted by all other defense agencies. the request for proposals was for a system that would be used for short-range, high resolution tactical video imagery of the seafloor, and of a surface feature or vessel, in a manner comparable to, but even more rapid than, current methods. the system could also be used to conduct autonomous surveying. this was to be done by

creating images on the seafloor or on vessels and vessels, and by the systems operating under the control of the platform. the system was intended to supplement other information systems such as radar, sonar, and other shipboard sensors, and would provide a supplement to sensor data that is already being collected. data could be delivered to the navy's data center in real time or over the network.
