Then again, there are mitigating circumstances. Three software companies are making nice things for example. The ones mentioned above are all currently using Creative Cloud to add and sync their applications to it. Obviously, Adobe gave no thought to the needs of those of us who don't use Creative Cloud. Lightroom users are that way. The company should not have provided a new version of Lightroom with a cloud-based issue and not really made it possible to revert if Lightroom 5 is a bad buy. Maybe I am being too demanding, but this is a deal-breaking issue. Reproducing this problem is the result of Adobe being insincere, and it needs to be addressed. The rest of what needs to be said here is much more mundane. Lightroom 5 is just solid as rock. It started with a snappy start up. While importing images, it made some initial adjustments. It got more responsive as I worked. Lightroom 5 makes it easy to restore images that were backed up in Adobe's massive database. There's still room for improvement, however, as it's rather slow to let me choose which backup or rotated version of an image I want. In any case, it's a very solid experience. I don't know if it's possible to control the appearance of Lightroom's new Apple-style spotlight, but I would hope so. It's sometimes distracting to me, and it would be better to be able to turn it off. Lightroom 5 is faster than Lightroom 4. It can import/export files twice as fast, and it's also about 30% faster when it comes to organizing and searching. It's also faster when you're scrolling. Photoshop CS6 is more powerful than Lightroom 4, but it's also more resource-hungry. It's new Content-Aware Scale tool (CAS) is amazing. At one point during my reviews, I was wasting 15 minutes a day using Lightroom 2's equivalent of this feature. After I switched the test images over to an image of a Leaf Blower I'll use in upcoming articles, I saved 5 minutes a day on each image, which I feel is entirely worth the price of admission. Lightroom 5 continues where previous version left off.

In both Lightroom and Photoshop, you can carry over a folder or file by choosing to use the Move Data function. To move content you can use the keyboard or move the location of the contents using the mouse. You can create multiple versions of existing content and even delete it at any time. Ordering and naming content is similar to the single product. You can also apply any edits to all the images in the catalog at once - this way you won't be making all the same edits over and over. In Photoshop and Lightroom there is the ability to add new Adjustment Layers to your image to modify specific elements to achieve certain results. If you decrease the shutter speed to blur objects in an image the Camera Shake Layer will blur the parts of the image that aren't in focus and if you remove a layer affects the way the image appeared on the camera. All adjustment layers are treated the same — they are added to the bottom of the document and not to the image layers. Now that your Photoshop is updated on the computer, you can create a new file or open one you've got in the program. On the menu bar, there are two icons: an A and a C. Click on A and choose Create new document from the menu and create a new Photoshop document. At this point, you must choose a file format to be used in the new file. Click on the File Types tab that appears at the top of the menu on the left hand side. You'll want to use the Common or JPEG file type, specifically. Click OK and you're good to go. 933d7f57e6
