## **What's New In?**

Xelem is a small Java library for reading and writing SpreadsheetML files. It has several functions for working with SpreadsheetML files: reading, writing and converting. See also SpreadsheetML References External links Xelem Website SpreadsheetML at the

Category:SpreadsheetML Category:Free software programmed in Java (programming language)The present invention relates to a structure of a plate-like member such as a plate-like material or a belt-like material. In a plate-like member such as a plate-like material or a belt-like material, a flat upper surface or a curved outer surface is formed. In order to improve the appearance, high-quality appearance, high stiffness or the like of the surface of the plate-like member, a flat surface is formed on the surface of the plate-like member or the surface is formed with a curved surface having a desired curvature. Further, in

a multi-layer plate-like member formed by stacking plate-like members, in order to keep a flat upper surface of a top layer as it is, a flat surface is formed on the upper surface of the top layer. The plate-like member is generally formed by injection molding or press forming. In the case of the injection molding, high-cost molding die is used and in the case of the press forming, a metal mold is used and a plate-like material is pressure formed. Since there is a limit to the formability of the material, it is difficult to produce the plate-like member having the desired form. Therefore, it is not easy to form the surface of the plate-like member with the flat surface or the curved

surface of the desired form. As the plate-like member having the flat surface or the curved surface of the desired form, there are a steel plate and a rolled sheet. In the steel plate, a surface hardness is high and high-quality appearance cannot be obtained. In the rolled sheet, a sufficient softness is not obtained. Further, as the plate-like member having the flat surface or the curved surface of the desired form, there are a plate-like member produced by cutting a block-like body and a plate-like member produced by stacking plate-like members. However, in these plate-like members, high-quality appearance cannot be obtained because of cutting or stacking.

Further, when the surface of the plate-like member is formed with a concave shape, there arises a problem that the plate-like member cannot be produced at a low cost because of cutting work. It is an object of the present invention to provide a plate-like member having a flat surface or a curved surface of the desired form and also having a high-quality appearance.
