Adjust light as it comes in by removing light, or letting light escape through your subject/scene. Adobe has promised familiar light adjustment controls, but at a higher level of precision, so artists can quickly correct minor exposure issues in their subject or adjust lighting in an overall pleasing way. Shadows tend to be the easiest part of an image to adjust. Letting light get through is a great start, but as you can see in the live demonstration, you can also prevent backlighting, fill shadows with highlights in video clips, and set color on your subject by keeping or blocking light. Surprisingly for art and photography geeks, the same things that make a subject “pop” in lighting can also make it look strange, or steal attention from the compelling subject. Get the lighting just right to create the natural looking image below, and learn how to stop light, even light on skin, from looking strange by changing the look of reflected light with the settings in this video. For those who prefer to interact with their Photoshop in a more traditional way, you can get a lot of light-related control by turning on the Light Paths tool. This lets you adjust the look of the light path by changing it, adding to it, and removing it from your subject. What's hot in the new Adobe Photoshop CS6? CSS3 in all its glory.
