Similarly, Adobe has in recent years begun to utilize Adobe Sensei AI within the Auto-Fix and Style features of Face Photoshop. While these tools are still under active development, they are already showing much promise. The Face Photoshop tool can already predict Styles, but with minor tweaks will be able to accurately reorganize facial features, for example. Of course, the Photoshop Elements XE9 update also introduced a brand new oil painting experience. Authoring directly within Elements is now possible for a new range of brushes designed to evoke a different creativity experience. Once again, innovation and aesthetics are at the forefront of the new application. Choosing a new operating system is always a big change. After all, Adobe has been around for decades and we all know that we have a lot of customization to do to get onto an entirely new computer platform. Luckily, Adobe has done their homework and has done much to make Photoshop more mobile with a new Launcher app for Android and iOS. However, even under Android, the Launcher is a bit of a let down -- but not for large phones! It needs to be said that Photoshop is not a perfect editor. Featuring a lot of new technologies, including the aforementioned AE AI and Adobe Camera Raw/Lightroom integration, the feature set is a bit more demanding than in recent Lightroom. Unfortunately, it's not always perfect. Some users may not realize that when a file is opened, it does not open in its own graphics window; instead, the image is copied to a new window with the same name. This is different from opening a new file and having Photoshop bring in the new contents of the file. It can be disruptive if there's a lot of editing to be done or if you're working on a Timeline in Photoshop. It doesn't happen in every case, but it's a reminder that not every editing operation you perform will be recorded in the file itself.
